NOD-Rag-Perforin Akita - Mouse Strain RES211**Mouse Information**

Common Name:	NOD-Rag-Perforin Akita
MGI Official Name:	NOD.Cg-Rag1 ^{tm1Mor} Ins2 ^{Akita} Prf1 ^{tm1Sdz} /Sz
Description:	The NOD-Rag1 ^{null} Prf1 ^{null} Ins2 ^{Akita} mouse is the first immunodeficient, spontaneously hyperglycemic mouse strain described that is based on the Ins2 ^{Akita} mutation. This strain is suitable as hosts for human islet and human beta stem and progenitor cell transplantation in the absence of the need for pharmacological induction of diabetes. This strain of mice also has low levels of innate immunity and can be engrafted with a human immune system for the study of human islet allograft rejection.
Categories:	HUMANE

Genetic Alterations

1) Targeted Mutagenesis					
Type of Allele	Global Null				
Targeted Gene	recombination activating gene 1 (Rag1 - NCBI GeneID:19373)				
Targeted Allele	<i>Not provided</i> (MGI:97848)				
Description of Targeting Vector	<i>Not provided</i>				
Targeting Vector Genbank File	<i>Not provided</i>				
Citations	<table border="1"> <thead> <tr> <th>PubMedID</th> <th>Citation</th> </tr> </thead> <tbody> <tr> <td>18785974</td> <td>Non-obese diabetic-recombination activating gene-1 (NOD-Rag1 null) interleukin (IL)-2 receptor common gamma chain (IL2r gamma null) null mice: a radioresistant model for human lymphohaematopoietic engraftment. Current Genetic Background: Not provided (date recorded: Not provided)

Strain Description: Not provided

Associated Images

Image 1

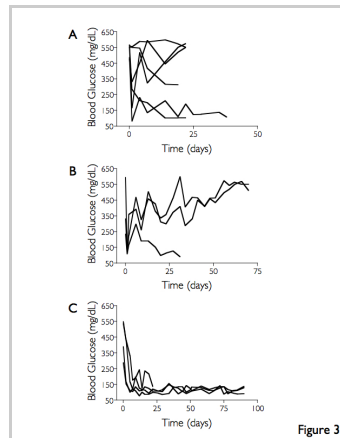

Description:

Spontaneous development of hyperglycemia in NOD-Rag1nullPrf1nullIns2+/Akita mice. Groups of mice were analysed for the development of hyperglycemia over time and stratified by sex. Additionally, littermates of each sex were typed at Ins2 to determine mice that were homozygous wild-type (white circles) or harboured a single Akita allele (black circles). (hyperglycemia)

Reference:

18563383

Image 2

Description:

Reversal of diabetes in NOD-Rag1null Prf1 null Ins2+/Akita mice following human islet transplantation. Hyperglycemic male mice were randomised into three groups and received either 2,000 (a, n=6), 3,000 (b, n=3), or 4,000 (c, n=4) IEQ of human islets into the renal subcapsular space. Blood glucose levels in individual mice at each human islet dose are shown over the follow-up period. (islet transplantation)
